Overview

This document provides the details of an OVP Fast Processor Model variant.

OVP Fast Processor Models are written in C and provide a C API for use in C based platforms. The models also provide a native interface for use in SystemC TLM2 platforms.

The models are written using the OVP VMI API that provides a Virtual Machine Interface that defines the behavior of the processor. The VMI API makes a clear line between model and simulator allowing very good optimization and world class high speed performance. Most models are provided as a binary shared object and also as source. This allows the download and use of the model binary or the use of the source to explore and modify the model.

The models are run through an extensive QA and regression testing process and most model families are validated using technology provided by the processor IP owners. There is a companion document (OVP Guide to Using Processor Models) which explains the general concepts of OVP Fast Processor Models and their use. It is downloadable from the OVPworld website documentation pages.

1.1 Description

RISC-V CV32E40P 32-bit processor model

1.2 Licensing

This Model is released under the Open Source Apache 2.0

1.3 Extensions

The model has the following architectural extensions enabled, and the following bits in the misa CSR Extensions field will be set upon reset:

misa bit 2: extension C (compressed instructions)

```
misa bit 8: RV32I/64I/128I base ISA
```

misa bit 12: extension M (integer multiply/divide instructions)

misa bit 23: extension X (non-standard extensions present)

To specify features that can be dynamically enabled or disabled by writes to the misa register in addition to those listed above, use parameter "add_Extensions_mask". This is a string parameter containing the feature letters to add; for example, value "DV" indicates that double-precision floating point and the Vector Extension can be enabled or disabled by writes to the misa register.

Legacy parameter "misa_Extensions_mask" can also be used. This Uns32-valued parameter specifies all writable bits in the misa Extensions field, replacing any value defined in the base variant.

Note that any features that are indicated as present in the misa mask but absent in the misa will be ignored. See the next section.

1.3.1 Available (But Not Enabled) Extensions

The following extensions are supported by the model, but not enabled by default in this variant:

```
misa bit 0: extension A (atomic instructions) (NOT ENABLED)
```

misa bit 1: extension B (bit manipulation extension) (NOT ENABLED)

misa bit 3: extension D (double-precision floating point) (NOT ENABLED)

misa bit 4: RV32E base ISA (NOT ENABLED)

misa bit 5: extension F (single-precision floating point) (NOT ENABLED)

misa bit 7: extension H (hypervisor) (NOT ENABLED)

misa bit 10: extension K (cryptographic) (NOT ENABLED)

misa bit 13: extension N (user-level interrupts) (NOT ENABLED)

misa bit 18: extension S (Supervisor mode) (NOT ENABLED)

misa bit 20: extension U (User mode) (NOT ENABLED)

misa bit 21: extension V (vector extension) (NOT ENABLED)

To add features from this list to the base variant, use parameter "add_Extensions". This is a string parameter containing the feature letters to add; for example, value "DV" indicates that double-precision floating point and the Vector Extension should be enabled, if they are absent.

Legacy parameter "misa_Extensions" can also be used. This Uns32-valued parameter specifies the reset value for the misa CSR Extensions field, replacing any value defined in the base variant.

1.4 General Features

On this variant, the Machine trap-vector base-address register (mtvec) is writable. It can instead be configured as read-only using parameter "mtvec_is_ro".

Values written to "mtvec" are masked using the value 0xffffff01. A different mask of writable bits may be specified using parameter "mtvec_mask" if required. In addition, when Vectored interrupt mode is enabled, parameter "tvec_align" may be used to specify additional hardware-enforced base address alignment. In this variant, "tvec_align" defaults to 0, implying no alignment constraint.

The initial value of "mtvec" is 0x1. A different value may be specified using parameter "mtvec" if required.

On reset, the model will restart at address 0x0. A different reset address may be specified using parameter "reset_address" if required.

On an NMI, the model will restart at address 0x0. A different NMI address may be specified using parameter "nmi_address" if required.

WFI will halt the processor until an interrupt occurs. It can instead be configured as a NOP using parameter "wfi_is_nop". WFI timeout wait is implemented with a time limit of 0 (i.e. WFI causes an Illegal Instruction trap in Supervisor mode when mstatus.TW=1).

The "cycle" CSR is implemented in this variant. Set parameter "cycle_undefined" to True to instead specify that "cycle" is unimplemented and reads of it should trap to Machine mode.

The "time" CSR is not implemented in this variant and reads of it will require emulation in Machine mode. Set parameter "time_undefined" to False to instead specify that "time" is implemented.

The "instret" CSR is implemented in this variant. Set parameter "instret_undefined" to True to instead specify that "instret" is unimplemented and reads of it should trap to Machine mode.

Unaligned memory accesses are supported by this variant. Set parameter "unaligned" to "F" to disable such accesses.

A PMP unit is not implemented by this variant. Set parameter "PMP_registers" to indicate that the unit should be implemented with that number of PMP entries.

1.5 CLIC

The model can be configured to implement a Core Local Interrupt Controller (CLIC) using parameter "CLICLEVELS"; when non-zero, the CLIC is present with the specified number of interrupt levels (2-256), as described in the RISC-V Core-Local Interrupt Controller specification (see references). When "CLICLEVELS" is non-zero, further parameters are made available to configure other aspects of the CLIC, as described below.

The model can configured either to use an internal CLIC model (if parameter "externalCLIC" is False) or to present a net interface to allow the CLIC to be implemented externally in a platform component (if parameter "externalCLIC" is True). When the CLIC is implemented internally, net ports for standard interrupts and additional local interrupts are available. When the CLIC is implemented externally, a net port interface allowing the highest-priority pending interrupt to be delivered is instead present. This is described below.

1.5.1 CLIC Common Parameters

This section describes parameters applicable whether the CLIC is implemented internally or externally. These are:

"CLICANDBASIC": this Boolean parameter indicates whether both CLIC and basic interrupt controller are present (if True) or whether only the CLIC is present (if False).

"CLICXNXTI": this Boolean parameter indicates whether xnxti CSRs are implemented (if True) or unimplemented (if False).

"CLICXCSW": this Boolean parameter indicates whether xscratchesw and xscratcheswl CSRs registers are implemented (if True) or unimplemented (if False).

"mclicbase": this parameter specifies the CLIC base address in physical memory.

"tvt_undefined": this Boolean parameter indicates whether xtvt CSRs registers are implemented (if True) or unimplemented (if False). If the registers are unimplemented then the model will use basic mode vectored interrupt semantics based on the xtvec CSRs instead of Selective Hardware Vectoring semantics described in the specification.

"intthresh_undefined": this Boolean parameter indicates whether xintthresh CSRs registers are implemented (if True) or unimplemented (if False).

"mclicbase_undefined": this Boolean parameter indicates whether the mclicbase CSR register is implemented (if True) or unimplemented (if False).

1.5.2 CLIC Internal-Implementation Parameters

This section describes parameters applicable only when the CLIC is implemented internally. These are:

"CLICCFGMBITS": this Uns32 parameter indicates the number of bits implemented in cliccfg.nmbits, and also indirectly defines CLICPRIVMODES. For cores which implement only Machine mode, or which implement Machine and User modes but not the N extension, the parameter is absent ("CLICCFGMBITS" must be zero in these cases).

"CLICCFGLBITS": this Uns32 parameter indicates the number of bits implemented in clic-cfg.nlbits.

"CLICSELHVEC": this Boolean parameter indicates whether Selective Hardware Vectoring is supported (if True) or unsupported (if False).

1.5.3 CLIC External-Implementation Net Port Interface

When the CLIC is externally implemented, net ports are present allowing the external CLIC model to supply the highest-priority pending interrupt and to be notified when interrupts are handled. These are:

"irq_id_i": this input should be written with the id of the highest-priority pending interrupt.

"irq_lev_i": this input should be written with the highest-priority interrupt level.

"irq_sec_i": this 2-bit input should be written with the highest-priority interrupt security state (00:User, 01:Supervisor, 11:Machine).

"irq_shv_i": this input port should be written to indicate whether the highest-priority interrupt should be direct (0) or vectored (1). If the "tvt_undefined parameter" is False, vectored interrupts will use selective hardware vectoring, as described in the CLIC specification. If "tvt_undefined" is True, vectored interrupts will behave like basic mode vectored interrupts.

"irq_id_i": this input should be written with the id of the highest-priority pending interrupt.

"irq.i": this input should be written with 1 to indicate that the external CLIC is presenting an interrupt, or 0 if no interrupt is being presented.

"irq_ack_o": this output is written by the model on entry to the interrupt handler (i.e. when the interrupt is taken). It will be written as an instantaneous pulse (i.e. written to 1, then immediately 0).

"irq_id_o": this output is written by the model with the id of the interrupt currently being handled. It is valid during the instantaneous irq_ack_o pulse.

"sec_lvl_o": this output signal indicates the current secure status of the processor, as a 2-bit value (00=User, 01:Supervisor, 11=Machine).

1.6 Interrupts

The "reset" port is an active-high reset input. The processor is halted when "reset" goes high and resumes execution from the reset address specified using the "reset_address" parameter when the signal goes low. The "mcause" register is cleared to zero.

The "nmi" port is an active-high NMI input. The processor resumes execution from the address specified using the "nmi_address" parameter when the NMI signal goes high. The "mcause" register is cleared to zero.

All other interrupt ports are active high. For each implemented privileged execution level, there are by default input ports for software interrupt, timer interrupt and external interrupt; for example, for Machine mode, these are called "MSWInterrupt", "MTimerInterrupt" and "MExternalInterrupt", respectively. When the N extension is implemented, ports are also present for User mode. Parameter "unimp_int_mask" allows the default behavior to be changed to exclude certain interrupt ports. The parameter value is a mask in the same format as the "mip" CSR; any interrupt corresponding to a non-zero bit in this mask will be removed from the processor and read as zero in "mip", "mie" and "mideleg" CSRs (and Supervisor and User mode equivalents if implemented).

Parameter "external_int_id" can be used to enable extra interrupt ID input ports on each hart. If the parameter is True then when an external interrupt is applied the value on the ID port is sampled and used to fill the Exception Code field in the "mcause" CSR (or the equivalent CSR for other execution levels). For Machine mode, the extra interrupt ID port is called "MExternalInterruptID".

The "deferint" port is an active-high artifact input that, when written to 1, prevents any pending-and-enabled interrupt being taken (normally, such an interrupt would be taken on the next instruction after it becomes pending-and-enabled). The purpose of this signal is to enable alignment with hardware models in step-and-compare usage.

1.7 Debug Mode

The model can be configured to implement Debug mode using parameter "debug_mode". This implements features described in Chapter 4 of the RISC-V External Debug Support specification with version specified by parameter "debug_version" (see References). Some aspects of this mode are not defined in the specification because they are implementation-specific; the model provides infrastructure to allow implementation of a Debug Module using a custom harness. Features added are described below.

Parameter "debug_mode" can be used to specify three different behaviors, as follows:

- 1. If set to value "vector", then operations that would cause entry to Debug mode result in the processor jumping to the address specified by the "debug_address" parameter. It will execute at this address, in Debug mode, until a "dret" instruction causes return to non-Debug mode. Any exception generated during this execution will cause a jump to the address specified by the "dexc_address" parameter.
- 2. If set to value "interrupt", then operations that would cause entry to Debug mode result in the processor simulation call (e.g. opProcessorSimulate) returning, with a stop reason of OP_SR_INTERRUPT. In this usage scenario, the Debug Module is implemented in the simulation harness.
- 3. If set to value "halt", then operations that would cause entry to Debug mode result in the processor halting. Depending on the simulation environment, this might cause a return from the simulation call with a stop reason of OP_SR_HALT, or debug mode might be implemented by another platform component which then restarts the debugged processor again.

1.7.1 Debug State Entry

The specification does not define how Debug mode is implemented. In this model, Debug mode is enabled by a Boolean pseudo-register, "DM". When "DM" is True, the processor is in Debug mode. When "DM" is False, mode is defined by "mstatus" in the usual way.

Entry to Debug mode can be performed in any of these ways:

- 1. By writing True to register "DM" (e.g. using opProcessorRegWrite) followed by simulation of at least one cycle (e.g. using opProcessorSimulate), dcsr cause will be reported as trigger;
- 2. By writing a 1 then 0 to net "haltreq" (using opNetWrite) followed by simulation of at least one cycle (e.g. using opProcessorSimulate);
- 3. By writing a 1 to net "resethaltreq" (using opNetWrite) while the "reset" signal undergoes a negedge transition, followed by simulation of at least one cycle (e.g. using opProcessorSimulate);
- 4. By executing an "ebreak" instruction when Debug mode entry for the current processor mode is enabled by dcsr.ebreakm, dcsr.ebreaks or dcsr.ebreaku.

In all cases, the processor will save required state in "dpc" and "dcsr" and then perform actions described above, depending in the value of the "debug_mode" parameter.

1.7.2 Debug State Exit

Exit from Debug mode can be performed in any of these ways:

- 1. By writing False to register "DM" (e.g. using opProcessorRegWrite) followed by simulation of at least one cycle (e.g. using opProcessorSimulate);
- 2. By executing an "dret" instruction when Debug mode.

In both cases, the processor will perform the steps described in section 4.6 (Resume) of the Debug specification.

1.7.3 Debug Registers

When Debug mode is enabled, registers "dcsr", "dpc", "dscratch0" and "dscratch1" are implemented as described in the specification. These may be manipulated externally by a Debug Module using opProcessorRegRead or opProcessorRegWrite; for example, the Debug Module could write "dcsr" to enable "ebreak" instruction behavior as described above, or read and write "dpc" to emulate stepping over an "ebreak" instruction prior to resumption from Debug mode.

1.7.4 Debug Mode Execution

The specification allows execution of code fragments in Debug mode. A Debug Module implementation can cause execution in Debug mode by the following steps:

- 1. Write the address of a Program Buffer to the program counter using opProcessorPCSet;
- 2. If "debug_mode" is set to "halt", write 0 to pseudo-register "DMStall" (to leave halted state);
- 3. If entry to Debug mode was handled by exiting the simulation callback, call opProcessorSimulate or opRootModuleSimulate to resume simulation.

Debug mode will be re-entered in these cases:

- 1. By execution of an "ebreak" instruction; or:
- 2. By execution of an instruction that causes an exception.

In both cases, the processor will either jump to the debug exception address, or return control immediately to the harness, with stopReason of OP_SR_INTERRUPT, or perform a halt, depending on the value of the "debug_mode" parameter.

1.7.5 Debug Single Step

When in Debug mode, the processor or harness can cause a single instruction to be executed on return from that mode by setting dcsr.step. After one non-Debug-mode instruction has been executed, control will be returned to the harness. The processor will remain in single-step mode until dcsr.step is cleared.

1.7.6 Debug Ports

Port "DM" is an output signal that indicates whether the processor is in Debug mode

Port "haltreq" is a rising-edge-triggered signal that triggers entry to Debug mode (see above).

Port "resethaltreq" is a level-sensitive signal that triggers entry to Debug mode after reset (see above).

1.8 Debug Mask

It is possible to enable model debug messages in various categories. This can be done statically using the "override_debugMask" parameter, or dynamically using the "debugflags" command. Enabled messages are specified using a bitmask value, as follows:

Value 0x002: enable debugging of PMP and virtual memory state;

Value 0x004: enable debugging of interrupt state.

All other bits in the debug bitmask are reserved and must not be set to non-zero values.

1.9 Integration Support

This model implements a number of non-architectural pseudo-registers and other features to facilitate integration.

1.9.1 CSR Register External Implementation

If parameter "enable_CSR_bus" is True, an artifact 16-bit bus "CSR" is enabled. Slave callbacks installed on this bus can be used to implement modified CSR behavior (use opBusSlaveNew or icmMapExternalMemory, depending on the client API). A CSR with index 0xABC is mapped on the bus at address 0xABC0; as a concrete example, implementing CSR "time" (number 0xC01) externally requires installation of callbacks at address 0xC010 on the CSR bus.

1.10 Limitations

Instruction pipelines are not modeled in any way. All instructions are assumed to complete immediately. This means that instruction barrier instructions (e.g. fence.i) are treated as NOPs, with the exception of any Illegal Instruction behavior, which is modeled.

Caches and write buffers are not modeled in any way. All loads, fetches and stores complete immediately and in order, and are fully synchronous. Data barrier instructions (e.g. fence) are treated as NOPs, with the exception of any Illegal Instruction behavior, which is modeled.

Real-world timing effects are not modeled: all instructions are assumed to complete in a single cycle.

Hardware Performance Monitor registers are not implemented and hardwired to zero.

Certain custom features of the CV32E40P are unimplemented. The following Registers are unimplemented: PCCRs, MIEX, MIPX, PCER, PCMR, HWLP PRIVLV. The Custom instructions are unimplemented

1.11 Verification

All instructions have been extensively tested by Imperas, using tests generated specifically for this model and also reference tests from https://github.com/riscv/riscv-tests.

Also reference tests have been used from various sources including:

https://github.com/riscv/riscv-tests

https://github.com/ucb-bar/riscv-torture

The Imperas OVPsim RISC-V models are used in the RISC-V Foundation Compliance Framework as a functional Golden Reference:

https://github.com/riscv/riscv-compliance

where the simulated model is used to provide the reference signatures for compliance testing. The Imperas OVPsim RISC-V models are used as reference in both open source and commercial instruction stream test generators for hardware design verification, for example:

http://valtrix.in/sting from Valtrix

https://github.com/google/riscv-dv from Google

The Imperas OVPsim RISC-V models are also used by commercial and open source RISC-V Core RTL developers as a reference to ensure correct functionality of their IP.

1.12 References

The Model details are based upon the following specifications:

RISC-V Instruction Set Manual, Volume I: User-Level ISA (User Architecture Version 20190305-Base-Ratification)

RISC-V Instruction Set Manual, Volume II: Privileged Architecture (Privileged Architecture Version 20190405-Priv-MSU-Ratification)

RISC-V External Debug Support (RISC-V External Debug Support Version 0.13.2-DRAFT)

Configuration

2.1 Location

This model's VLNV is openhwgroup.ovpworld.org/processor/riscv/1.0.

The model source is usually at:

\$IMPERAS_HOME/ImperasLib/source/openhwgroup.ovpworld.org/processor/riscv/1.0

The model binary is usually at:

\$IMPERAS_HOME/lib/\$IMPERAS_ARCH/ImperasLib/openhwgroup.ovpworld.org/processor/riscv/1.0

2.2 GDB Path

The default GDB for this model is: \$IMPERAS_HOME/lib/\$IMPERAS_ARCH/gdb/riscv-none-embed-gdb.

2.3 Semi-Host Library

The default semi-host library file is riscv.ovpworld.org/semihosting/pk/1.0

2.4 Processor Endian-ness

This is a LITTLE endian model.

2.5 QuantumLeap Support

This processor is qualified to run in a QuantumLeap enabled simulator.

2.6 Processor ELF code

The ELF code supported by this model is: 0xf3.

All Variants in this model

This model has these variants

Variant	Description
CV32E40P	(described in this document)

Table 3.1: All Variants in this model

Bus Master Ports

This model has these bus master ports.

Name	min	max	Connect?	Description
INSTRUCTION	32	34	mandatory	Instruction bus
DATA	32	34	optional	Data bus
CSR	16	16	optional	Artifact bus allowing external implemen-
				tation of CSR registers

Table 4.1: Bus Master Ports

Bus Slave Ports

This model has no bus slave ports.

Net Ports

This model has these net ports.

Name	Type	Connect?	Description
reset	input	optional	Reset
nmi	input	optional	NMI
MSWInterrupt	input	optional	Machine software interrupt
MTimerInterrupt	input	optional	Machine timer interrupt
MExternalInterrupt	input	optional	Machine external interrupt
LocalInterrupt0	input	optional	Local Interrupt 0
LocalInterrupt1	input	optional	Local Interrupt 1
LocalInterrupt2	input	optional	Local Interrupt 2
LocalInterrupt3	input	optional	Local Interrupt 3
LocalInterrupt4	input	optional	Local Interrupt 4
LocalInterrupt5	input	optional	Local Interrupt 5
LocalInterrupt6	input	optional	Local Interrupt 6
LocalInterrupt7	input	optional	Local Interrupt 7
LocalInterrupt8	input	optional	Local Interrupt 8
LocalInterrupt9	input	optional	Local Interrupt 9

LocalInterrupt11	input	optional	Local Interrupt 11
LocalInterrupt12	input	optional	Local Interrupt 12
LocalInterrupt13	input	optional	Local Interrupt 13
LocalInterrupt14	input	optional	Local Interrupt 14
LocalInterrupt15	input	optional	Local Interrupt 15
irq_ack_o	output	optional	interrupt acknowledge (pulse)
irq_id_o	output	optional	acknowledged interrupt id (valid during
			irq_ack_o pulse)
sec_lvl_o	output	optional	current privilege level
DM	output	optional	Debug state indication
haltreq	input	optional	haltreq (Debug halt request)
resethaltreq	input	optional	resethaltreq (Debug halt request after re-
			set)
deferint	input	optional	Artifact signal causing interrupts to be
			held off when high

Table 6.1: Net Ports

FIFO Ports

This model has no FIFO ports.

Formal Parameters

Name	Type	Description
variant	Enumeration	Selects variant (either a generic UISA or a specific model)
user_version Enumeration		Specify required User Architecture version (2.2, 2.3 or 20190305)
priv_version	Enumeration	Specify required Privileged Architecture version (1.10, 1.11, 20190405 or
		master)
debug_version	Enumeration	Specify required Debug Architecture version (0.13.2-DRAFT or 0.14.0-
		DRAFT)
debug_mode	Enumeration	Specify how Debug mode is implemented (none, vector, interrupt or halt)
debug_address	Uns64	Specify address to which to jump to enter debug in vectored mode
dexc_address	Uns64	Specify address to which to jump on debug exception in vectored mode
verbose	Boolean	Specify verbose output messages
unaligned	Boolean	Specify whether the processor supports unaligned memory accesses
wfi_is_nop	Boolean	Specify whether WFI should be treated as a NOP (if not, halt while waiting
		for interrupts)
mtvec_is_ro	Boolean	Specify whether mtvec CSR is read-only
tvec_align	Uns32	Specify hardware-enforced alignment of mtvec/stvec/utvec when Vectored
		interrupt mode enabled
counteren_mask	Uns32	Specify hardware-enforced mask of writable bits in mcounteren/scounteren
		registers
noinhibit_mask Uns32		Specify hardware-enforced mask of always-zero bits in mcountinhibit register
mtvec_mask Uns64		Specify hardware-enforced mask of writable bits in mtvec register
$ecode_mask$	Uns64	Specify hardware-enforced mask of writable bits in xcause. Exception Code
ecode_nmi	Uns64	Specify xcause.ExceptionCode for NMI
tval_zero	Boolean	Specify whether mtval/stval/utval are hard wired to zero
tval_ii_code	Boolean	Specify whether mtval/stval contain faulting instruction bits on illegal in-
		struction exception
cycle_undefined	Boolean	Specify that the cycle CSR is undefined (reads to it are emulated by a
		Machine mode trap)
time_undefined	Boolean	Specify that the time CSR is undefined (reads to it are emulated by a Ma-
		chine mode trap)
$instret_undefined$	Boolean	Specify that the instret CSR is undefined (reads to it are emulated by a
		Machine mode trap)
enable_CSR_bus	Boolean	Add artifact CSR bus port, allowing CSR registers to be externally imple-
		mented
CSR_remap	String	Comma-separated list of CSR number mappings, each of the form <csr-< td=""></csr-<>
		Name>= <number></number>
xret_preserves_lr	Boolean	Whether an xRET instruction preserves the value of LR
$reset_address$	Uns64	Override reset vector address
$nmi_address$	Uns64	Override NMI vector address
PMP_grain	Uns32	Specify PMP region granularity, G $(0 => 4 \text{ bytes}, 1 => 8 \text{ bytes}, \text{ etc})$
PMP_registers	Uns32	Specify the number of implemented PMP address registers

PMP_max_page	Uns32	Specify the maximum size of PMP region to map if non-zero (may improve
		performance; constrained to a power of two)
local_int_num Uns32		Specify number of supplemental local interrupts
unimp_int_mask	Uns64	Specify mask of unimplemented interrupts (e.g. 1<<9 indicates Supervisor
		external interrupt unimplemented)
force_mideleg	Uns64	Specify mask of interrupts always delegated to lower-priority execution level
		from Machine execution level
no_ideleg	Uns64	Specify mask of interrupts that cannot be delegated to lower-priority execu-
		tion levels
no_edeleg	Uns64	Specify mask of exceptions that cannot be delegated to lower-priority exe-
		cution levels
external_int_id	Boolean	Whether to add nets allowing External Interrupt ID codes to be forced
endian	Endian	Model endian
misa_MXL	Uns32	Override default value of misa.MXL
misa_MXL_mask	Uns32	Override mask of writable bits in misa.MXL
misa_Extensions	Uns32	Override default value of misa. Extensions
add_Extensions	String	Add extensions specified by letters to misa. Extensions (for example, specify
		"VD" to add V and D features)
misa_Extensions_mask	Uns32	Override mask of writable bits in misa. Extensions
add_Extensions_mask	String	Add extensions specified by letters to mask of writable bits in
		misa.Extensions (for example, specify "VD" to add V and D features)
mvendorid	Uns64	Override mvendorid register
marchid	Uns64	Override marchid register
mimpid	Uns64	Override mimpid register
mhartid	Uns64	Override mhartid register (or first mhartid of an incrementing sequence if
		this is an SMP variant)
mtvec	Uns64	Override mtvec register
CLICLEVELS	Uns32	Specify number of interrupt levels implemented by CLIC, or 0 if CLIC absent

Table 8.1: Parameters that can be set in: Hart

8.1 Extension Parameters

Name	Type
debug	Boolean

Table 8.2: Extension Parameters

8.2 Parameters with enumerated types

8.2.1 Parameter user_version

Set to this value	Description
2.2	User Architecture Version 2.2
2.3	Deprecated and equivalent to 20190305
20190305	User Architecture Version 20190305-Base-Ratification

Table 8.3: Values for Parameter user_version

8.2.2 Parameter priv_version

Set to this value	Description

1.10	Privileged Architecture Version 1.10
1.11	Deprecated and equivalent to 20190405
20190405	Privileged Architecture Version 20190405-Priv-MSU-Ratification
master	Privileged Architecture Master Branch (1.12 draft)

Table 8.4: Values for Parameter priv_version

8.2.3 Parameter debug_version

Set to this value	Description
0.13.2-DRAFT	RISC-V External Debug Support Version 0.13.2-DRAFT
0.14.0-DRAFT	RISC-V External Debug Support Version 0.14.0-DRAFT

Table 8.5: Values for Parameter debug_version

8.2.4 Parameter debug_mode

Set to this value	Description
none	Debug mode not implemented
vector	Debug mode implemented by execution at vector
interrupt	Debug mode implemented by interrupt
halt	Debug mode implemented by halt

Table 8.6: Values for Parameter debug_mode

Execution Modes

Mode	Code	Description					
Machine	3	Machine mode					
Debug	6	Debug mode					

Table 9.1: Modes implemented in: Hart

Exceptions

Exception	Code	Description
InstructionAddressMisaligned	0	Fetch from unaligned address
InstructionAccessFault	1	No access permission for fetch
IllegalInstruction	2	Undecoded, unimplemented or disabled instruc-
		tion
Breakpoint	3	EBREAK instruction executed
LoadAddressMisaligned	4	Load from unaligned address
LoadAccessFault	5	No access permission for load
StoreAMOAddressMisaligned	6	Store/atomic memory operation at unaligned
		address
StoreAMOAccessFault	7	No access permission for store/atomic memory
		operation
EnvironmentCallFromMMode	11	ECALL instruction executed in Machine mode
InstructionPageFault	12	Page fault at fetch address
LoadPageFault	13	Page fault at load address
StoreAMOPageFault	15	Page fault at store/atomic memory operation
		address
MSWInterrupt	67	Machine software interrupt
MTimerInterrupt	71	Machine timer interrupt
MExternalInterrupt	75	Machine external interrupt
LocalInterrupt0	80	Local interrupt 0
LocalInterrupt1	81	Local interrupt 1
LocalInterrupt2	82	Local interrupt 2
LocalInterrupt3	83	Local interrupt 3
LocalInterrupt4	84	Local interrupt 4
LocalInterrupt5	85	Local interrupt 5
LocalInterrupt6	86	Local interrupt 6
LocalInterrupt7	87	Local interrupt 7
LocalInterrupt8	88	Local interrupt 8
LocalInterrupt9	89	Local interrupt 9
LocalInterrupt10	90	Local interrupt 10
LocalInterrupt11	91	Local interrupt 11
LocalInterrupt12	92	Local interrupt 12

LocalInterrupt13	93	Local interrupt 13
LocalInterrupt14	94	Local interrupt 14
LocalInterrupt15	95	Local interrupt 15

Table 10.1: Exceptions implemented in: Hart

Hierarchy of the model

A CPU core may be configured to instance many processors of a Symmetrical Multi Processor (SMP). A CPU core may also have sub elements within a processor, for example hardware threading blocks.

OVP processor models can be written to include SMP blocks and to have many levels of hierarchy. Some OVP CPU models may have a fixed hierarchy, and some may be configured by settings in a configuration register. Please see the register definitions of this model.

This model documentation shows the settings and hierarchy of the default settings for this model variant.

11.1 Level 1: Hart

This level in the model hierarchy has 2 commands.

This level in the model hierarchy has 3 register groups:

Group name	Registers
Core	33
Machine_Control_and_Status	179
Integration_support	2

Table 11.1: Register groups

This level in the model hierarchy has no children.

Model Commands

A Processor model can implement one or more **Model Commands** available to be invoked from the simulator command line, from the OP API or from the Imperas Multiprocessor Debugger.

12.1 Level 1: Hart

12.1.1 isync

specify instruction address range for synchronous execution

Argument	Type	Description
-addresshi	Uns64	end address of synchronous execution range
-addresslo	Uns64	start address of synchronous execution range

Table 12.1: isync command arguments

12.1.2 itrace

enable or disable instruction tracing

Argument	Type	Description
-after	Uns64	apply after this many instructions
-enable	Boolean	enable instruction tracing
-instructioncount	Boolean	include the instruction number in each trace
-off	Boolean	disable instruction tracing
-on	Boolean	enable instruction tracing
-registerchange	Boolean	show registers changed by this instruction
-registers	Boolean	show registers after each trace

Table 12.2: itrace command arguments

Table 13.2: Registers at level 1, type:Hart group:Machine_Control_and_Status

13.1.3 Integration_support

Registers at level:1, type:Hart group:Integration_support

Name	Bits	Initial-Hex	RW	Description
DM	8	0	rw	Debug mode active
commercial	8	0	r-	Commercial feature in use

Table 13.3: Registers at level 1, type:Hart group:Integration_support

^{*} Registers marked with an asterisk are part of the processor extension library.
